

**YF109**

**32 Bit Microcontroller with Built-in 2.4G**

**Product Specification**

## 1. General Description

The YF109 microcontroller utilizes a high-performance 32-bit ARM® Cortex®-M0+ core, offering a wide voltage operating range. With up to 32Kbytes of flash memory and 4Kbytes of SRAM, it achieves a maximum operating frequency of 32MHz. The chip integrates various communication peripherals, including I2C, SPI, and USART, as well as a 12-bit ADC, five 16-bit timers, and two comparators.

In addition, the YF109 microcontroller features an embedded 2.4GHz wireless transceiver module. Operating within the 2.400GHz to 2.483GHz ISM frequency band, it can reach a maximum transmit power of 8dBm. In open environments, its transmission range can reach 120+ meters, while its receiver adopts a low intermediate frequency structure with a sensitivity of up to -86dBm. This module achieves high integration and requires a minimum of only two capacitors and a crystal oscillator as external components.

Operating across a temperature range of -40°C to 85°C and a voltage range of 1.7V to 5.5V (2.4GHz operation from 2V to 3.6V), the YF109 microcontroller provides low-power modes, including sleep and stop, catering to diverse low-power applications.

The YF109 microcontroller is suitable for various applications, including controllers, wireless handheld devices, smart homes, IoT systems, remote-controlled toys, wireless industrial control devices and etc.

### 1.1 Features

- **Core**

32-bit ARM Cortex-M0+ core

- **Memory**

16 to 32Kbytes of flash memory

2 to 4Kbytes of SRAM

- **Low Power**

Current in STOP mode: <4.5uA (VDD=1V)

Wake-up time from STOP mode: <3.5μs

- **System**

Supports HSI, HSE, LSI clocks

Maximum clock frequency: up to 24/32MHz

Wide operating voltage range: 1.7V to 5.5V

Operating temperature range: -40°C to 85°C / -40°C to 105°C

- **Peripherals**

Up to 18 GPIOs

1x I2C, 1x SPI, 2x USART, 4x 16-bit GPTimer, RTC

1x ADTimer (Three-phase BLDC/PMSM control module)

1x LPTimer, internal temperature sensor

1x 12-bit ADC (10 channels), 2x COMP

## 1.2 2.4G Wireless Module

- **Low power consumption**

Operating current in transmission mode (0dBm): 16mA

Operating current in receiving mode: 14mA

Sleep current: 1.5uA

- **High integration**

Only requires 2 capacitors and one crystal oscillator for peripheral components

- **Low cost**

Supports 16MHz crystal oscillator with ±60ppm accuracy

Supports double-sided PCB design

Supports SOP8 package option

Supports SPI interface communication

Can be used with microstrip antennas on PCB

- **High performance**

Receiver sensitivity in 1Mbps mode: -86dBm

Maximum transmission power in 1Mbps mode for special applications: 8dBm, achieving a transmission distance of over 120 meters in open areas

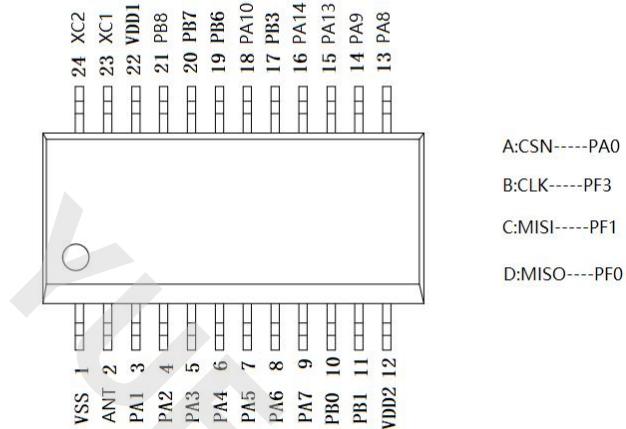

Excellent interference resistance with high adjacent channel suppression in the receiver filter

- **Built-in auto re-transmission and auto\_ack functionality.**

- **Supports 4-wire SPI interface, with a maximum speed of up to 8Mbps.**
